The publisher regrets that Fig. 3 in the above article was printed incorrectly. The correct Fig. 3 is printed on the following page.
Fig. 3. Relative position of the IMTs for four rainfall events (1993–1994 intercrop). Horizontal and vertical bars indicate confidence interval (95%) relating to the three post-harvest soil conditions. The tillage treatments were no-tillage (1), mouldboard ploughing (2), mustard intercrop (3), early cultivation (4) and late cultivation (5). For the rainfall events of 14/09/93 and 4/10/93, late cultivation (5) was identical to no tillage (1) because tillage had not yet occurred.
