ON CERTAIN CLASSES OF ANALYTIC FUNCTIONS DEFINED BY MEANS OF A LINEAR OPERATOR

ALI MUHAMMAD

ABSTRACT. In this paper, we introduce certain classes of analytic functions in the unit disk. The object of the present paper is to derive some interesting properties of functions belonging to these classes.

2000 Mathematics Subject Classification: 30C45, 30C50.

KEYWORDS: Analytic functions, convex and starlike functions of order alpha, Quasi-convex functions, Functions with positive real part, integral operator.

1. INTRODUCTION

Let $A$ denote the class of functions of the form

$$f(z) = z + \sum_{n=2}^{\infty} a_n z^n,$$

(1.1)

which are analytic in the unit disc $E = \{z : z \in \mathbb{C}, |z| < 1\}$. Let the functions $f_i$ be defined for $i = 1, 2$, by

$$f_i(z) = z + \sum_{n=2}^{\infty} a_{n,i} z^n,$$

(1.2)

The modified Hadamard product (convolution) of $f_1$ and $f_2$ is defined here by

$$(f_1 \ast f_2)(z) = z + \sum_{n=2}^{\infty} a_{n,1} a_{n,2} z^n.$$ 

Let $P_k(\rho)$ be the class of functions $h(z)$ analytic in $E$ satisfying the properties $h(0) = 1$ and

$$\int_0^{2\pi} \left| \frac{\text{Re} h(z) - \rho}{1 - \rho} \right| d\theta \leq k\pi,$$

(1.3)
where $z = re^{i\theta}$, $k \geq 2$ and $0 \leq \rho < 1$. This class has been introduced in [10]. We note, for $\rho = 0$, we obtain the class $P_k$ defined and studied in [11], and for $\rho = 0$, $k = 2$, we have the well-known class $P$ of functions with positive real part. The case $k = 2$ gives the class $P(\rho)$ of functions with positive real part greater than $\rho$. From (1.3) we can easily deduce that $h \in P_k(\rho)$ if and only if, there exists $h_1, h_2 \in P(\rho)$ such that for $z \in E$,

$$h(z) = \left(\frac{k}{4} + \frac{1}{2}\right)h_1(z) - \left(\frac{k}{4} - \frac{1}{2}\right)h_2(z).$$

(1.4)

where $h_i(z) \in P(\rho), i = 1, 2$ and $z \in E$.

We have the following classes

$$R_k(\alpha) = \left\{ f : f \in A \text{ and } \frac{zf'(z)}{f(z)} \in P_k(\alpha), z \in E, 0 \leq \alpha < 1 \right\},$$

we note that $R_2(\alpha) = S^*(\alpha)$ is the class of starlike functions of order $\alpha$.

$$V_k(\alpha) = \left\{ f : f \in A \text{ and } \frac{(zf'(z))'}{f'(z)} \in P_k(\alpha), z \in E, 0 \leq \alpha < 1 \right\}.$$

Note that $V_2(\alpha) = C(\alpha)$ is the class of convex functions of order $\alpha$.

$$T_k(\rho, \alpha) = \left\{ f : f \in A, g \in R_2(\alpha) \text{ and } \frac{zf'(z)}{f(z)} \in P_k(\rho), z \in E, 0 \leq \alpha, \rho < 1 \right\},$$

$$T_k^*(\rho, \alpha) = \left\{ f : f \in A, g \in V_2(\alpha) \text{ and } \frac{(zf'(z))'}{f'(z)} \in P_k(\rho), z \in E, 0 \leq \alpha, \rho < 1 \right\}.$$

In particular, the class $T_2^*(\rho, \alpha) = C(\rho, \alpha)$ was introduced by Noor [8] and for $T_2^*(0, 0) = C^*$ is the class of quasi-convex univalent functions which was first introduced and studied in [7].

It is obvious from the above definition that

$$f(z) \in V_k(\alpha) \iff zf'(z) \in R_k(\alpha),$$

$$f(z) \in T_k^*(\rho, \alpha) \iff zf'(z) \in T_k(\rho, \alpha).$$

(1.5) (1.6)

Let $f \in A$. Denote $D^\lambda : A \longrightarrow A$ the operator defined by

$$D^\lambda f(z) = \frac{z}{(1 - z)^{\lambda+1}} * f(z), \quad (\lambda > -1).$$
It is obvious that $D^0 f(z) = f(z)$, $D^1 f(z) = zf'(z)$ and

$$D^k f(z) = \frac{z(z^{k-1}f(z))^{(k)}}{k!}, \quad k \in \mathbb{N}_0 = \{0, 1, 2, \ldots\}. $$

The operator $D^k f(z)$ is called the kth order Ruscheweyh derivative of $f$. Recently Noor [6] and Noor [9] defined and studied an integral operator $I_n: A \rightarrow A$ analogous to $D^k f$ as follows.

Let $f_n(z) = \frac{z}{(1-z)^{n+1}}$, $n \in \mathbb{N}_0$ and let $f_n^{(-1)}$ be defined such that

$$f_n(z) * f_n^{(-1)}(z) = \frac{z}{(1-z)^2}.$$

Then

$$I_n = f_n^{(-1)}(z) * f = \left[\frac{z}{(1-z)^{n+1}}\right]^{(-1)} * f.$$

We note that $I_0 f(z) = zf'(z)$ and $I_1 f(z) = f(z)$. The operator $I_n$ is called the Noor integral operator of nth order, see [2, 5].

For any complex numbers $a, b, c$ other than $0, -1, -2...$ the hypergeometric series is defined by

$$2F_1(a, b; c; z) = 1 + \frac{ab}{c!}z + \frac{a(a+1)b(b+1)}{c(c+1)2!} z^2 + .... \quad (1.7)$$

We note that the series (1.7) converges absolutely for all $z$ so that it represents an analytic function in $E$. Also an incomplete beta function $\phi(a, c, z)$ is related to the Gauss hypergeometric function $2F_1(a, b; c; z)$ as

$$2F_1(1, b; c; z) = \phi(a, c, z),$$

and we note that $\phi(2, 1, z) = \frac{z}{(1-z)^2}$, where $\phi(2, 1, z)$ is the Koebe function. Using $\phi(a, c, z)$ a convolution operator, see [1] was defined by Carlson and Shaffer. We introduce a function $(z 2F_1(a, b; c; z))^{(-1)}$ given by

$$(z 2F_1(a, b; c; z)) * (z 2F_1(a, b; c; z))^{(-1)} = \frac{z}{(1-z)\lambda+1}, \quad (\lambda > -1),$$

and obtain the following linear operator:

$$I_\lambda(a, b, c)f(z) = (z 2F_1(a, b; c; z))^{(-1)} * f(z), \quad (1.8)$$

where $a, b, c$ are real numbers other $0, -1, -2, -3, ...$, $\lambda > -1$, $z \in E$ and $f \in A$. The operator $I_\lambda$ is known as the generalized Noor integral operator. In particular, with
where $b = 1$, the operator was studied in [3] for p-valent functions. By some computation we note that

$$I_\lambda(a, b, c)f(z) = z + \sum_{k=1}^{\infty} \frac{(c)_k(a)_{k+1}}{(b)_k(1)_k} a_k z^k,$$

(1.9)

where $(x)_k$ is the Pochhammer symbol defined by $(x)_k = x(x+1)...(x+k-1)$, $k = 1, 2, ..., \text{and } (x)_0 = 1, k = 0$.

From (1.8), we note that

$$I_\lambda(a, \lambda + 1, a)f(z) = f(z), \quad I_\lambda(a, 1, a)f(z) = zf'(z).$$

Also it can easily be verified that

$$z(I_\lambda(a, b, c)f(z))' = \lambda I_{\lambda+1}(a, b, c)f(z) - \lambda I_\lambda(a, b, c)f(z).$$

(1.10)

$$z(I_\lambda(a + 1, b, c)f(z))' = a I_\lambda(a, b, c)f(z) - (a - 1) I_\lambda(a + 1, b, c)f(z).$$

(1.11)

We define the following subclasses.

**Definition 1.1.** Let $f \in A$. Then $f \in R_k(a, b, c, \lambda, \alpha)$ if and only if $I_\lambda(a, b, c)f(z) \in R_k(a, \alpha)$, for $z \in E$.

**Definition 1.2.** Let $f \in A$. Then $f \in V_k(a, b, c, \lambda, \alpha)$ if and only if $I_\lambda(a, b, c)f(z) \in V_k(a, \alpha)$, for $z \in E$.

**Definition 1.4.** Let $f \in A$. Then $f \in T_k(a, b, c, \lambda, \rho, \alpha)$ if and only if $I_\lambda(a, b, c)f(z) \in T_k(\rho, \alpha)$, for $z \in E$.

**Definition 1.5.** Let $f \in A$. Then $f \in T_k^*(a, b, c, \lambda, \rho, \alpha)$ if and only if $I_\lambda(a, b, c)f(z) \in T_k^*(\rho, \alpha)$, for $z \in E$.

We shall need the following result.

**Lemma 1.1** [4]. Let $u = u_1 + iu_2$, $v = v_1 + iv_2$ and $\Psi(u, v)$ be a complex valued function satisfying the conditions: (i). $\Psi(u, v)$ is continuous in a domain $D \subset \mathbb{C}^2$, (ii). $(1, 0) \in D$ and $\text{Re} \, \Psi(1, 0) > 0$, (iii). $\text{Re} \, \Psi(iu_2, v_1) \leq 0$, whenever $(iu_2, v_1) \in D$ and $v_1 \leq -\frac{1}{2} (1 + u_2^2)$.

If $h(z) = 1 + c_1 z + \cdots$ is a function analytic in $E$ such that $(h(z), zh'(z)) \in D$ and $\text{Re} \{\Psi(h(z), zh'(z))\} > 0$ for $z \in E$, then $\text{Re} \, h(z) > 0$ in $E$.

2. **Main results**

**Theorem 2.1.** Let $f \in A$. Then

$$R_k(a, b, c, \lambda + 1, \alpha) \subset R_k(a, b, c, \lambda, \alpha),$$

where $\alpha$ is given by

$$\alpha = \frac{2}{(2\lambda + 1) + \sqrt{(2\lambda + 1)^2 + 8}}.$$
Proof. Let \( f \in R_k(a, b, c, \lambda + 1, \alpha) \) and let

\[
\frac{z(I_\lambda(a, b, c)f(z))'}{I_\lambda(a, b, c)f(z)} = p(z) = \left( \frac{k}{4} + \frac{1}{2} \right) p_1(z) - \left( \frac{k}{4} - \frac{1}{2} \right) p_2(z).
\]

Then \( p(z) \) is analytic in \( E \) with \( p(0) = 1 \). Some computation and use of (1.10) yields

\[
\frac{z(I_\lambda+1(a, b, c)f(z))'}{I_\lambda+1(a, b, c)f(z)} = \left\{ p(z) + \frac{zp'(z)}{p(z) + \lambda} \right\} \in P_k, \quad z \in E.
\]

Let

\[
\Phi_\lambda(z) = \sum_{j=1}^{\infty} \frac{\lambda + j}{\lambda + 1} z^j = \frac{\lambda}{\lambda + 1} \frac{z}{(1 - z)} + \frac{1}{\lambda + 1} \frac{z}{(1 - z)^2}.
\]

Then

\[
p(z) * \Phi_\lambda(z) = p(z) + \frac{zp'(z)}{p(z) + \lambda}.
\]

\[
= \left( \frac{k}{4} + \frac{1}{2} \right) \left\{ p_1(z) * \Phi_\lambda(z) \right\} - \left( \frac{k}{4} - \frac{1}{2} \right) \left\{ p_2(z) * \Phi_\lambda(z) \right\}
\]

\[
= \left( \frac{k}{4} + \frac{1}{2} \right) \left[ p_1(z) + \frac{zp'_1(z)}{p_1(z) + \lambda} \right] - \left( \frac{k}{4} - \frac{1}{2} \right) \left[ p_2(z) + \frac{zp'_2(z)}{p_2(z) + \lambda} \right],
\]

and implies that

\[
\left[ p_i(z) + \frac{zp'_i(z)}{p_i(z) + \lambda} \right] \in P, \quad i = 1, 2, \quad z \in E.
\]

We want to show that \( p_i(z) \in P(\alpha) \), where \( \alpha \) is given by (2.1) and this will show that \( p \in P_k \) for \( z \in E \). Let

\[
p_i(z) = (1 - \alpha) h_i(z) + \alpha, \quad i = 1, 2.
\]

Then

\[
\left[ (1 - \alpha) h_i(z) + \alpha + \frac{(1 - \alpha)zh_i'(z)}{h_i(z) + \alpha + \lambda} \right] \in P.
\]

We form the functional \( \Psi(u, v) \) by choosing \( u = h_i(z), \quad v = zh_i'(z) \).

\[
\Psi(u, v) = \left\{ (1 - \alpha)u + \alpha + \frac{(1 - \alpha)v}{(1 - \alpha)u + \alpha + \lambda} \right\}.
\]

The first two conditions of Lemma 1.1 are clearly satisfied. We verify the condition (iii) as follows.

\[
\text{Re}\{\Psi(iu_2^2, v_1)\} = \alpha + \left\{ \frac{(1 - \alpha)(\alpha + \lambda)v_1}{(\alpha + \lambda)^2 + (1 - \alpha)^2 u_2^2} \right\}.
\]
By putting $v \leq \frac{(1+u_2^2)}{2}$, we obtain

$$\text{Re}\{\Psi(iu_2^2, v_1)\} \leq \alpha - \frac{1}{2}\left\{\frac{(1-\alpha)(\alpha + \lambda)(1+u_2^2)}{(\alpha + \lambda)^2 + (1-\alpha)^2u_2^2}\right\}.$$  

$$= \frac{2\alpha(\alpha + \lambda)^2 + 2\alpha(1-\alpha)^2u_2^2 - (1-\alpha)(\alpha + \lambda) - (1-\alpha)(\alpha + \lambda)u_2^2}{2\{(\alpha + \lambda)^2 + (1-\alpha)^2u_2^2\}}.$$  

$$= \frac{A + Bu_2^2}{2C},$$

where

$$A = 2\alpha(\alpha + \lambda)^2 - (1-\alpha)(\alpha + \lambda),$$  

$$B = 2\alpha(1-\alpha)^2 - (1-\alpha)(\alpha + \lambda),$$  

$$C = (\alpha + \lambda)^2 + (1-\alpha)^2u_2^2 > 0.$$  

We notice that $\text{Re}\{\Psi(iu_2^2, v_1)\} \leq 0$ if and only if $A \leq 0, B \leq 0$. From $A \leq 0$, we obtain $\alpha$ as given by (2.1) and $B \leq 0$ gives us $0 \leq \rho < 1$. Therefore applying Lemma 1.1, $h_i \in P, i = 1, 2$ and consequently $h \in P_k(\rho)$ for $z \in E$. This completes the proof.

**Theorem 2.2.** For $\lambda > -1$,

$$V_k(a, b, c, \lambda + 1, 0) \subset V_k(a, b, c, \lambda, \alpha),$$

where $\alpha$ is given by (2.1).

**Proof.** Let $f \in V_k(a, b, c, \lambda + 1, 0).$ Then $I_{\lambda+1}(a, b, c)f(z) \in V_k(0) = V_k$ and by (1.5), $z(I_{\lambda+1}(a, b, c)f(z))' \in R_k(0) = R_k.$ This implies that $I_{\lambda+1}(a, b, c)(zf'(z)) \in R_k \Rightarrow zf'(z) \in R_k(a, b, c, \lambda + 1, 0) \subset R_k(a, b, c, \lambda, \alpha).$ Consequently $f \in V_k(a, b, c, \lambda, \alpha),$ where $\alpha$ is given by (2.1).

**Theorem 2.3.** Let $\lambda > -1$. Then

$$T_k(a, b, c, \lambda + 1, 0, 0) \subset T_k(a, b, c, \lambda, \gamma, \alpha),$$

where $\alpha$ is given by (2.1) and $\gamma \leq \rho$ is defined in the proof.

**Proof.** Let $f \in T_k(a, b, c, \lambda + 1, 0, 0).$ Then there exist $g \in R_2(a, b, c, \lambda + 1, 0, 0)$ such that

$$\frac{z(I_{\lambda+1}(a, b, c)f(z))'}{I_{\lambda+1}(a, b, c)g(z)} \in P_k(\rho), \text{ for } z \in E, \quad 0 \leq \rho < 1.$$  

Let

$$\frac{z(I_{\lambda}(a, b, c)f(z))'}{I_{\lambda}(a, b, c)g(z)} = (1-\gamma)p(z) + \gamma$$  

$$= \left\{(\frac{k}{4} + \frac{1}{2})\{(1-\gamma)p_1(z) + \gamma\} - \left(\frac{k}{4} - \frac{1}{2}\right)\{(1-\gamma)p_2(z) + \gamma\}, \right\}$$
where \( p(0) = 1 \), and \( p(z) \) is analytic in \( E \). Making use of (1.10) and Theorem 2.1 with \( k = 2 \), we have

\[
\left\{ \frac{z(I_{\lambda+1}(a, b, c)f(z))'}{I_{\lambda+1}(a, b, c)g(z)} - \rho \right\}
= \left\{ (1 - \gamma)p(z) + (\gamma - \rho) + \frac{(1 - \gamma)zp'(z)}{(1 - \alpha)q(z) + \alpha + \lambda} \right\} \in P_k,
\]

and \( q \in P \), where

\[
(1 - \alpha)q(z) + \alpha = \frac{z(I_{\lambda}(a, b, c)g(z))'}{I_{\lambda}(a, b, c)g(z)}, \quad z \in E.
\]

Using (1.4) we form the functional \( \varphi(u, v) \) by taking \( u = u_1 + iv_2 = p_i(z) \), \( v = v_1 + iv_2 = zp'_i(z) \) in (2.3) as

\[
\varphi(u, v) = (1 - \gamma)u + (\gamma - \rho) + \frac{(1 - \gamma)v}{(1 - \alpha)q(z) + \alpha + \lambda}.
\]

It can be easily seen that the function \( \varphi(u, v) \) defined by (2.4) satisfies the conditions \( (i) \) and \( (ii) \) of Lemma 1.1. To verify the condition \( (iii) \), we proceed with \( q(z) = q_1 + iq_2 \), as follows;

\[
\text{Re} \{ \varphi(iu_2, v_1) \} = (\gamma - \rho) + \text{Re} \left\{ \frac{(1 - \gamma)v_1}{(1 - \alpha)(q_1 + iq_2) + \alpha + \lambda} \right\}
= (\gamma - \rho) + \frac{(1 - \gamma)(1 - \alpha)v_1 q_1 + (1 - \gamma)(\alpha + \lambda)v_1}{[(1 - \alpha)q_1 + \alpha + \lambda]^2 + (1 - \alpha)^2 q_2^2}
= (\gamma - \rho) - \frac{1}{2} \frac{(1 - \gamma)(1 - \alpha)(1 + u_2^2)q_1 + (1 - \gamma)(\alpha + \lambda)(1 + u_2^2)}{[(1 - \alpha)q_1 + \alpha + \lambda]^2 + (1 - \alpha)^2 q_2^2} \leq 0, \quad \gamma \leq \rho < 1.
\]

Therefore applying Lemma 1.1, \( p_i \in P, i = 1, 2 \) and consequently \( p \in P_k \) and thus \( f \in T_k(a, b, c, \lambda, \gamma, \alpha) \).

Using the same technique and relation (1.6) with Theorem 2.3, we have the following result.

**Theorem 2.4.** For \( \lambda > -1 \),

\[
T_k^* (a, b, c, \lambda + 1, \rho, \alpha) \subseteq T_k^* (a, b, c, \lambda, \rho, \alpha),
\]

where \( \gamma \) and \( \alpha \) are given in Theorem 2.3.

We note that for different choices of parameters \( a, b, c, k \) and \( \lambda \) we obtain several interesting special cases for the result proved in this paper.
